Software Engineering

# Software Engineering

- Software = program + libraries + documentation
  - A program which serves some computational purpose
  - Collection of executable programming code, associated libraries and documentations
- Engineering
  - All about developing products using well defined principles, methods and procedures

① dev.   ② deploy   ③ maintain

# Software Engineering

- Associated with development of software product (application) using well defined scientific principles, methods and procedures
- The application of a systematic, disciplined , quantifiable approach to the development, operation and maintenance of software
- Establishment and use of sound engineering principles in order to obtain software that is reliable and work efficiently on real machines

# Software Evaluation

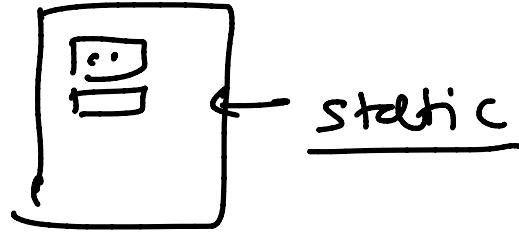

- The process of developing a software product using software engineering principles and methods
- includes
  - the initial development of software
  - its maintenance and updates, till desired software product is developed
- Includes different phases like requirement gathering, development, testing, deployment etc

# Software Evaluation

- Software Types

- 
- S-Type
  - P-Type
  - E-Type

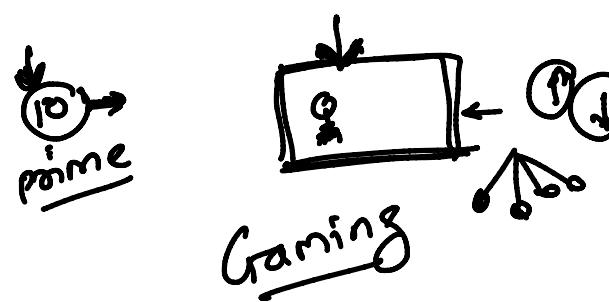

# S-Type software

- Static type → never changing
- Works strictly according to the pre-defined specifications and solutions
- Solution and method to achieve it can be understood immediately before coding starts
- Least subjected to the changes
- Simplest of all
- E.g.
  - Calculator program for mathematical computation

# P-Type Software

---

- Practical type
- Collection of different procedures
- Is defined by exactly what procedures can do
- The specification can be described and solutions are not obvious instantly
- E.g.
  - Gaming software

# E-Type software

→ TAX

evolution

- Embedded Type
- Works closely as the requirement of real-world environment
- Has a high degree of evolution as there are various changes in laws, taxes etc. in the real world
- E.g.
  - Online trading software
    - e-commerce

# E-Type software - laws

## ✓ Continuing change

- must continue to adapt to the real world changes, else it becomes progressively less useful

## ✓ Increasing complexity

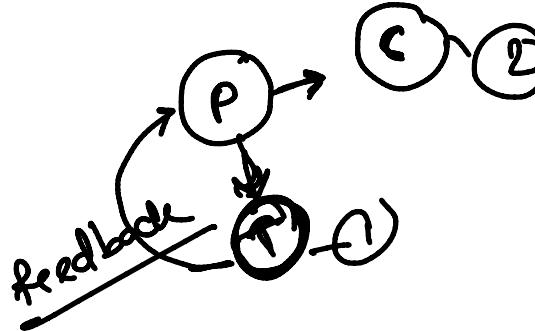

- As an E-type software system evolves, its complexity tends to increase unless work is done to maintain or reduce it

## ✓ Conservation of familiarity

- The familiarity with the software or the knowledge about how it was developed, why was it developed in that particular manner etc. must be retained at any cost, to implement the changes in the system

— KISS - keep it simple & stupid

# E-Type software - laws

## ✓ Continuing growth

- size of implementing the changes grows according to the lifestyle changes of the business

## ✓ Reducing quality

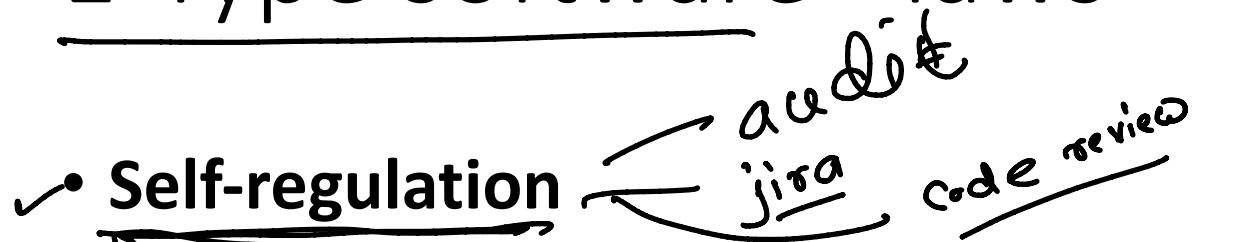

- declines in quality unless rigorously maintained and adapted to a changing operational environment

↗ tested

## ✓ Feedback systems

- constitute multi-loop, multi-level feedback systems and must be treated as such to be successfully modified or improved

# E-Type software - laws

## ✓ Self-regulation

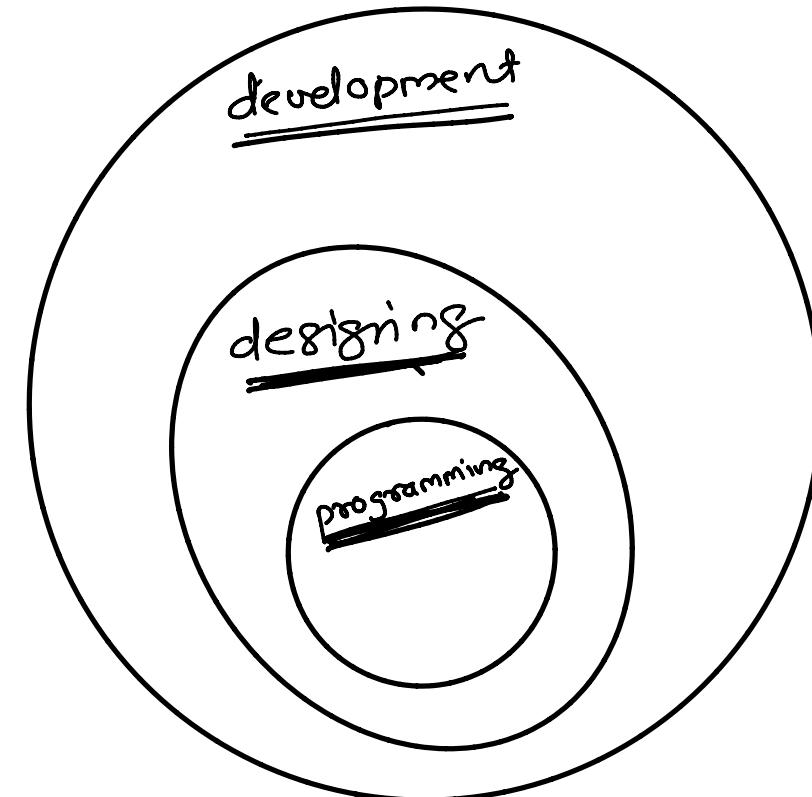

- evolution processes are self-regulating with the distribution of product and process measures close to normal

## ✓ Organizational stability

- The average effective global activity rate in an evolving E-type system is invariant over the lifetime of the product

# Software Paradigms

- Methods and steps, which are taken while designing the software
- Can be divided into
  - ✓ • Software Development Paradigm
  - ✓ • Software Design Paradigm
  - ✓ • Programming Paradigm

# Software Development Paradigm

---

- Is known as software engineering paradigms where all the engineering concepts pertaining to the development of software are applied
- Includes various researches and requirement gathering which helps the software product to build
- Consists of
  - ✓ Requirement gathering
  - ✓ Software design
  - ✓ Programming

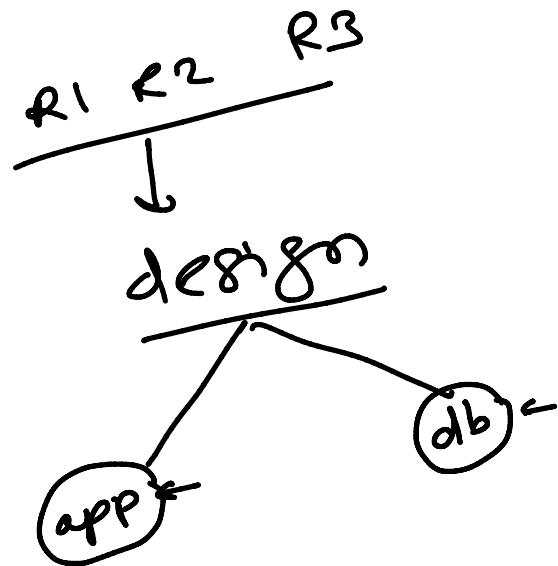

# Software Design Paradigm

- Is a part of Software Development

- Consists of

- ✓ Design
- ✓ Maintenance
- ✓ Programming

||

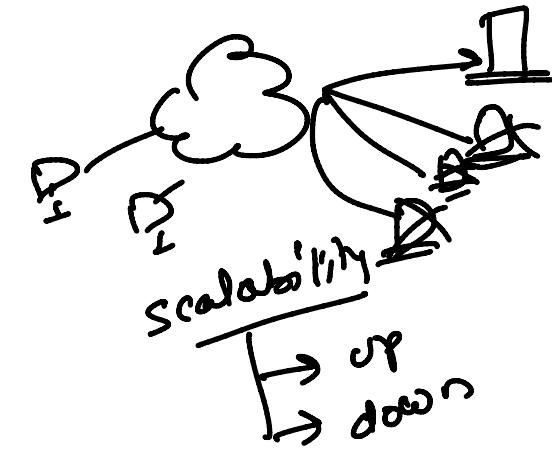

# Programming Paradigm

- Is related closely to programming aspect of software development
- Consists of
  - ✓ Coding
  - ✗ Testing
  - ✓ Integration → Jenkins

# Need of Software Engineering

- ✓ Large applications
- ✓ Scalability
- ✓ Cost
- ✓ Dynamic nature
- ✗ Quality management

AGILE  
- E-type

# Characteristics of good software

- A software product can be judged by what it offers and how well it can be used

- Well-engineered and crafted software is expected to have the following characteristics

- ✓ Operational
- ✓ Transactional
- ✓ Maintenance

SRS

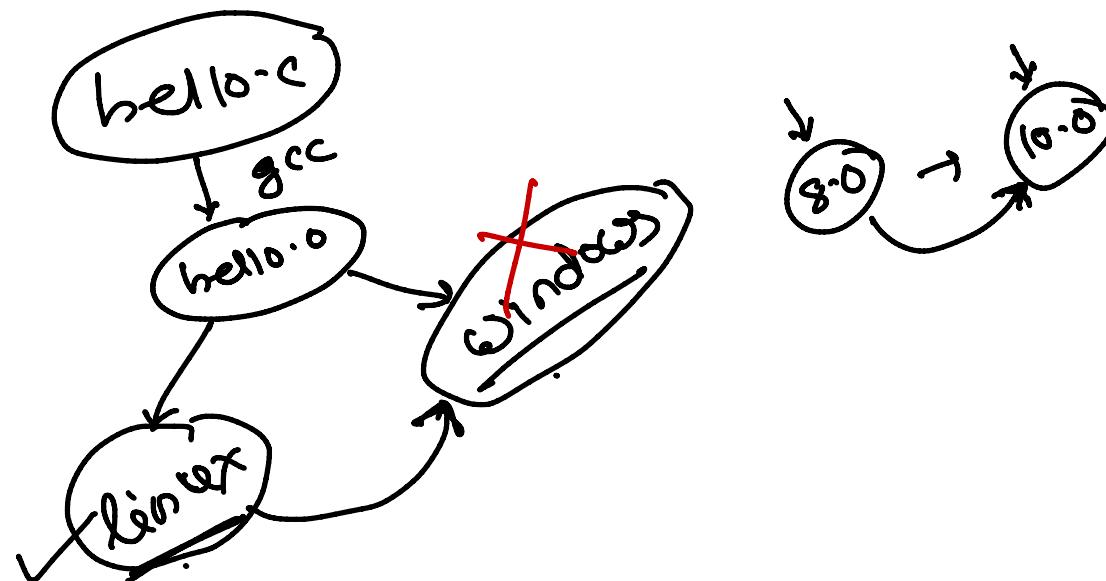

Documentation

# Operational

- This tells us how well software works in operations
- Can be measured on:
  - ✓ Budget
  - ✓ Usability
  - ✓ Efficiently
  - ✓ Correctness
  - ✓ Functionality
  - ✓ Dependability
  - ✓ Security — *authentication*
  - ✓ Safety —

# Transitional

- This aspect is important when the software is moved from one platform to another
- Can be measured on
  - ✓ Portability
  - ✓ Interoperability
  - ✓ Reusability
  - ✓ Adaptability

# Maintenance

- Briefs about how well a software has the capabilities to maintain itself in the ever-changing environment
- Can be measured on
  - ✓ Modularity
  - ✓ Maintainability
  - ✓ Flexibility
  - ✓ Scalability

# SDLC

Software Development Life Cycle

# SDLC (SDP)

- Software Development Life Cycle
- Also called as Software Development Process
- Is a well-defined, structured sequence of stages in software engineering to develop the intended software product
- Is a framework defining tasks performed at each step in the software development process
- Aims to produce a high-quality software that
  - meets or exceeds customer expectations (client)
  - reaches completion within times and cost estimates

# Organization

① Client communication

- negotiator ↓

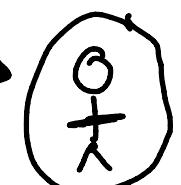

② Software Architect

- technology stack

frontend

backend

\$2M

client  
e-commerce

③ Project manager

T.M

End User

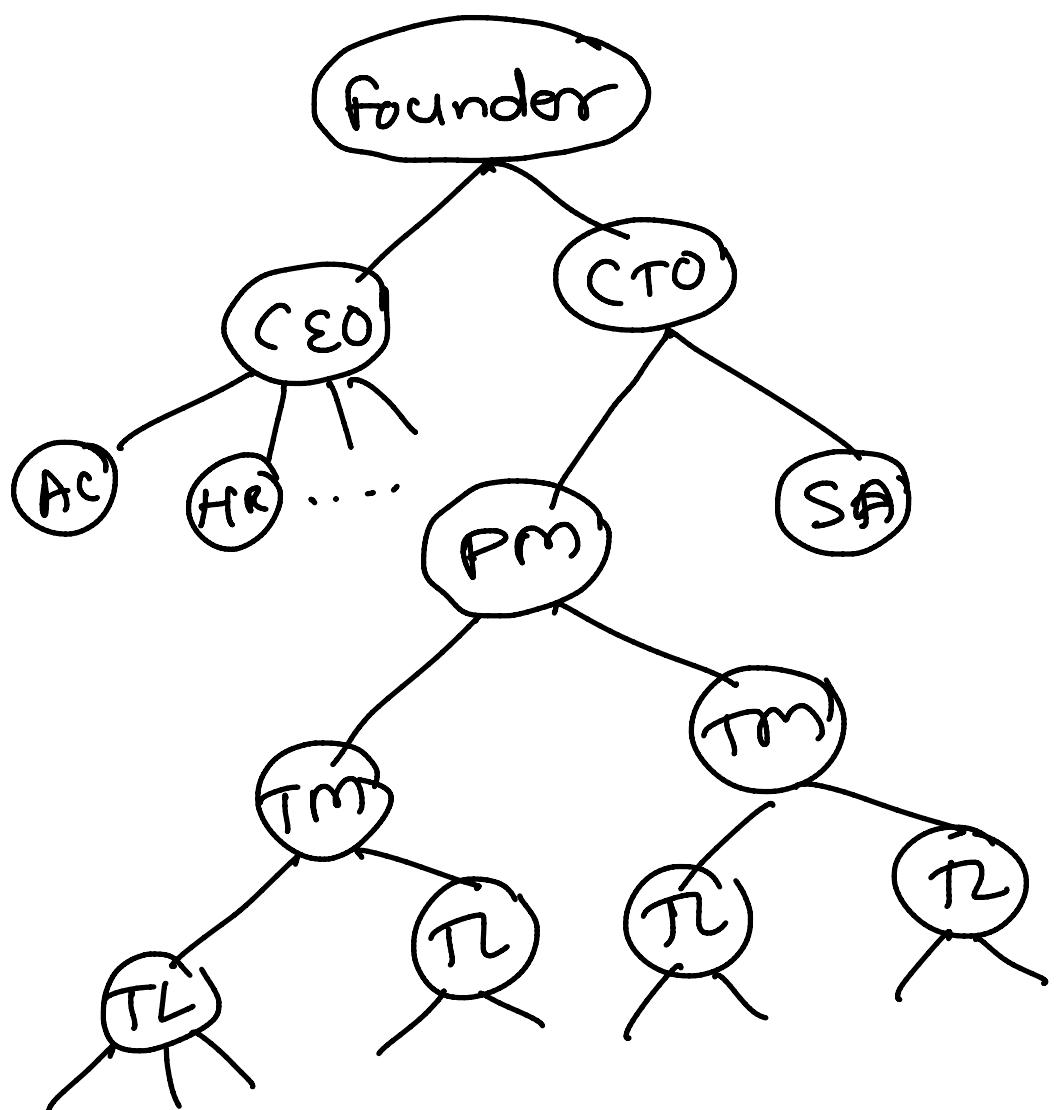

OPS

ad

ad

→ coder → developer

→ tester → tester

# SDLC

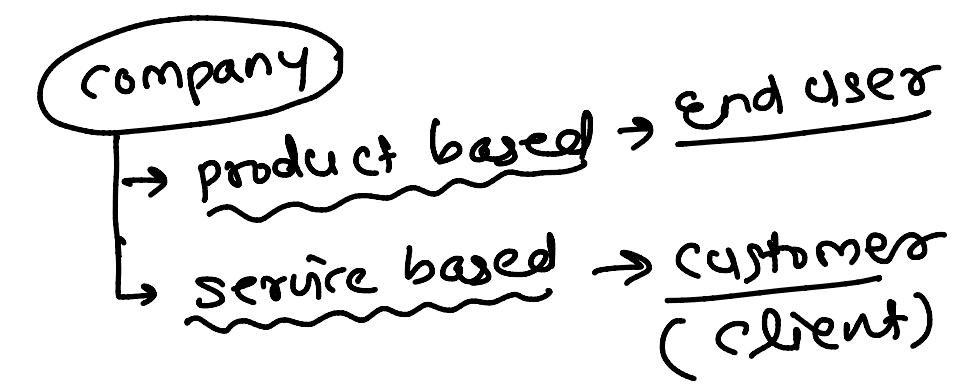

- Consists of detailed plan (stages) of describing how to develop, test, deploy and maintain the software product
- The stages are
  - ✓ Planning
  - ✓ Defining
  - ✓ Designing
    - ✓ ~~app~~ <sup>VI</sup>
    - ✓ <sup>db</sup> structure
  - ✓ Building
  - ✓ Testing
  - ✓ Deployment

# Planning and Requirement Analysis

- The most important and fundamental stage in SDLC
- It is performed by the senior members of the team with inputs from the customer, the sales department, market surveys and domain experts in the industry
- This information is then used to plan the basic project approach and to conduct product feasibility study in the  economical, operational and technical areas
- Planning for the quality assurance requirements and identification of the risks associated with the project is also done in the planning stage
- The outcome of the technical feasibility study is to define the various technical approaches that can be followed to implement the project successfully with minimum risks

# Defining Requirements

- Once the requirement analysis is done the next step is to clearly define and document the product requirements and get them approved from the customer or the market analysts
- This is done through an **SRS (Software Requirement Specification)** document which consists of all the product requirements to be designed and developed during the project life cycle

# E-commerce

## (A) Admin Panel

### i) Product management

- add product
- modify  
    ↳ price
- delete  
    ↳ metadata
- list

### ii) User management

- manage admin users
- block end user
- unblock end user
- send bills

### iii) Order management

- change order status
- close order
- suspend order

## (B) End user

### i) Product management

- list products
- add product to an order
- remove " "
- search product
- purchase a product

### ii) User management

- register a new account
- login to system
- close the account
- change profile

### iii) Order management

- create orders
- cancel orders
- pay

# Designing the Product Architecture

- SRS is the reference for product architects to come out with the best architecture for the product to be developed (csd)
- Based on the requirements specified in SRS, usually more than one design approach for the product architecture is proposed and documented in a DDS - Design Document Specification
- This DDS is reviewed by all the important stakeholders and based on various parameters as risk assessment, product robustness, design modularity, budget and time constraints, the best design approach is selected for the product

2 - 3 - 1

# Designing the Product Architecture

- A design approach clearly defines all the architectural modules of the product along with its communication and data flow representation with the external and third party modules (if any)
- The internal design of all the modules of the proposed architecture should be clearly defined with the minutest of the details in DDS

# Building or Developing the Product

```
/*
  Params:
    - p1 →
  Enums:
    - -
*/ function myfunction(p1) {
  -
  -
}
```

3

- In this stage of SDLC the actual development starts and the product is built
- The programming code is generated as per DDS during this stage
- If the design is performed in a detailed and organized manner, code generation can be accomplished without much hassle.
- Developers must follow the coding guidelines defined by their organization and programming tools like compilers, interpreters, debuggers, etc. are used to generate the code
- Different high level programming languages such as C, C++, Java, PHP etc. are used for coding
- The programming language is chosen with respect to the type of software being developed

# Testing the Product

- This stage is usually a subset of all the stages as in the modern SDLC models
- The testing activities are mostly involved in all the stages of SDLC
- However, this stage refers to the testing only stage of the product where product defects are reported, tracked, fixed and retested, until the product reaches the quality standards defined in the SRS

# Deployment in the Market and Maintenance

*well*

- Once the product is tested and ready to be deployed it is released formally in the appropriate market
- Sometimes product deployment happens in stages as per the business strategy of that organization
- The product may first be released in a limited segment and tested in the real business environment (UAT- User acceptance testing)
- Then based on the feedback, the product may be released as it is or with suggested enhancements in the targeting market segment
- After the product is released in the market, its maintenance is done for the existing customer base

*environment*

# SDLC Models

TSDP

- There are various software development life cycle models defined and designed which are followed during the software development process
- Also referred as Software Development Process Models
- Models
  - ✓ Waterfall Model
  - ✓ Iterative Model
  - ✓ Spiral Model
  - ✓ V-Model
  - ✓ Big Bang Model
  - Agile Model

# Waterfall Model

product

## Requirement Specification

- Design
- Implementation
- Verification and Testing
- Deployment
- Maintenance

Requirement Specifications

System Design

Design Implementation

Verification and Test

System Deployment

Software Maintenance

- The requirements for the software in terms of both design and functionality is captured

- Once the requirements are finalized, a blueprint of the system is drawn to facilitate the process of implementation

- The blueprint of the design is verified and the implementation of the system begins according to the blueprint

200%

1 year

1 month

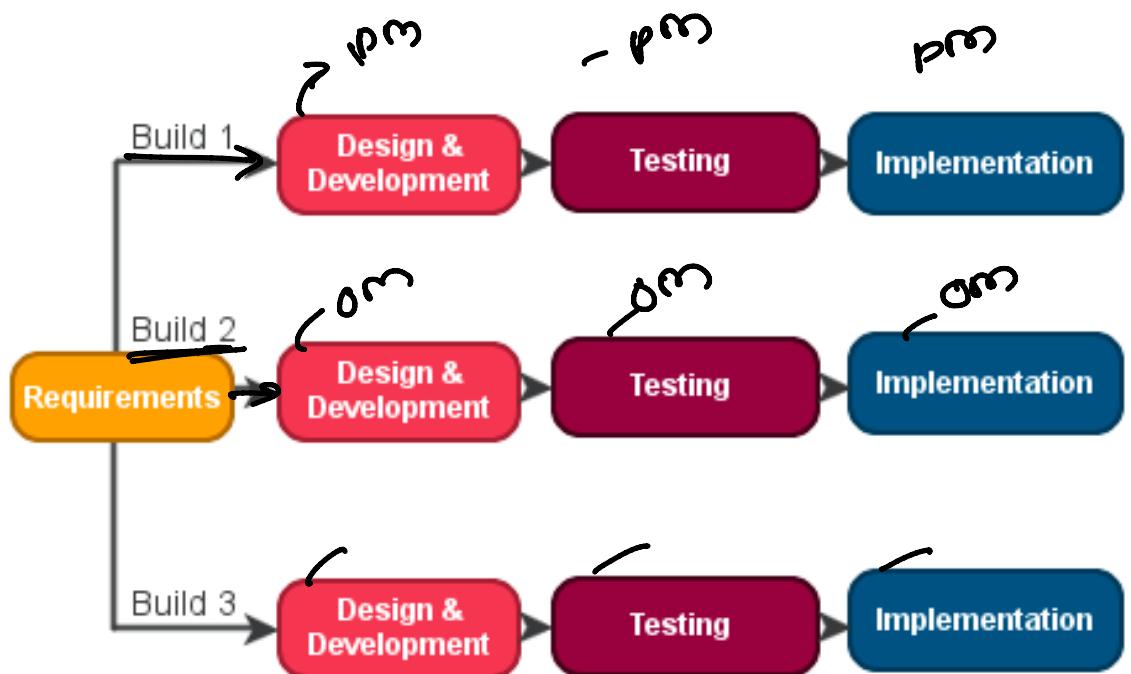

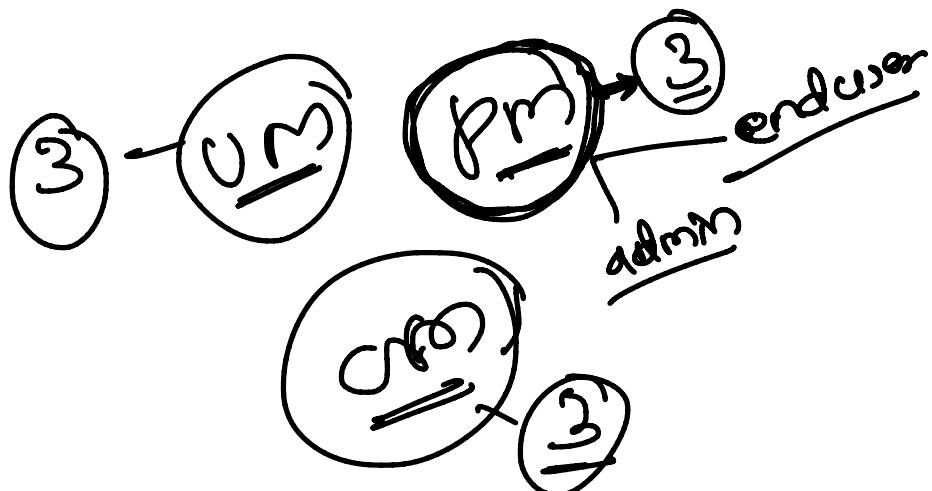

- The implemented system is now verified and tested by the team. Once the testing is complete, reversing the system to implement further changes in requirements cannot be done

- Setting up of the system or software after a pilot run and testing is done

- Regular updating, verification and debugging of the software

# Iterative Model

- implementation of a subset of the software requirements and iteratively enhances the evolving versions until the full system is implemented

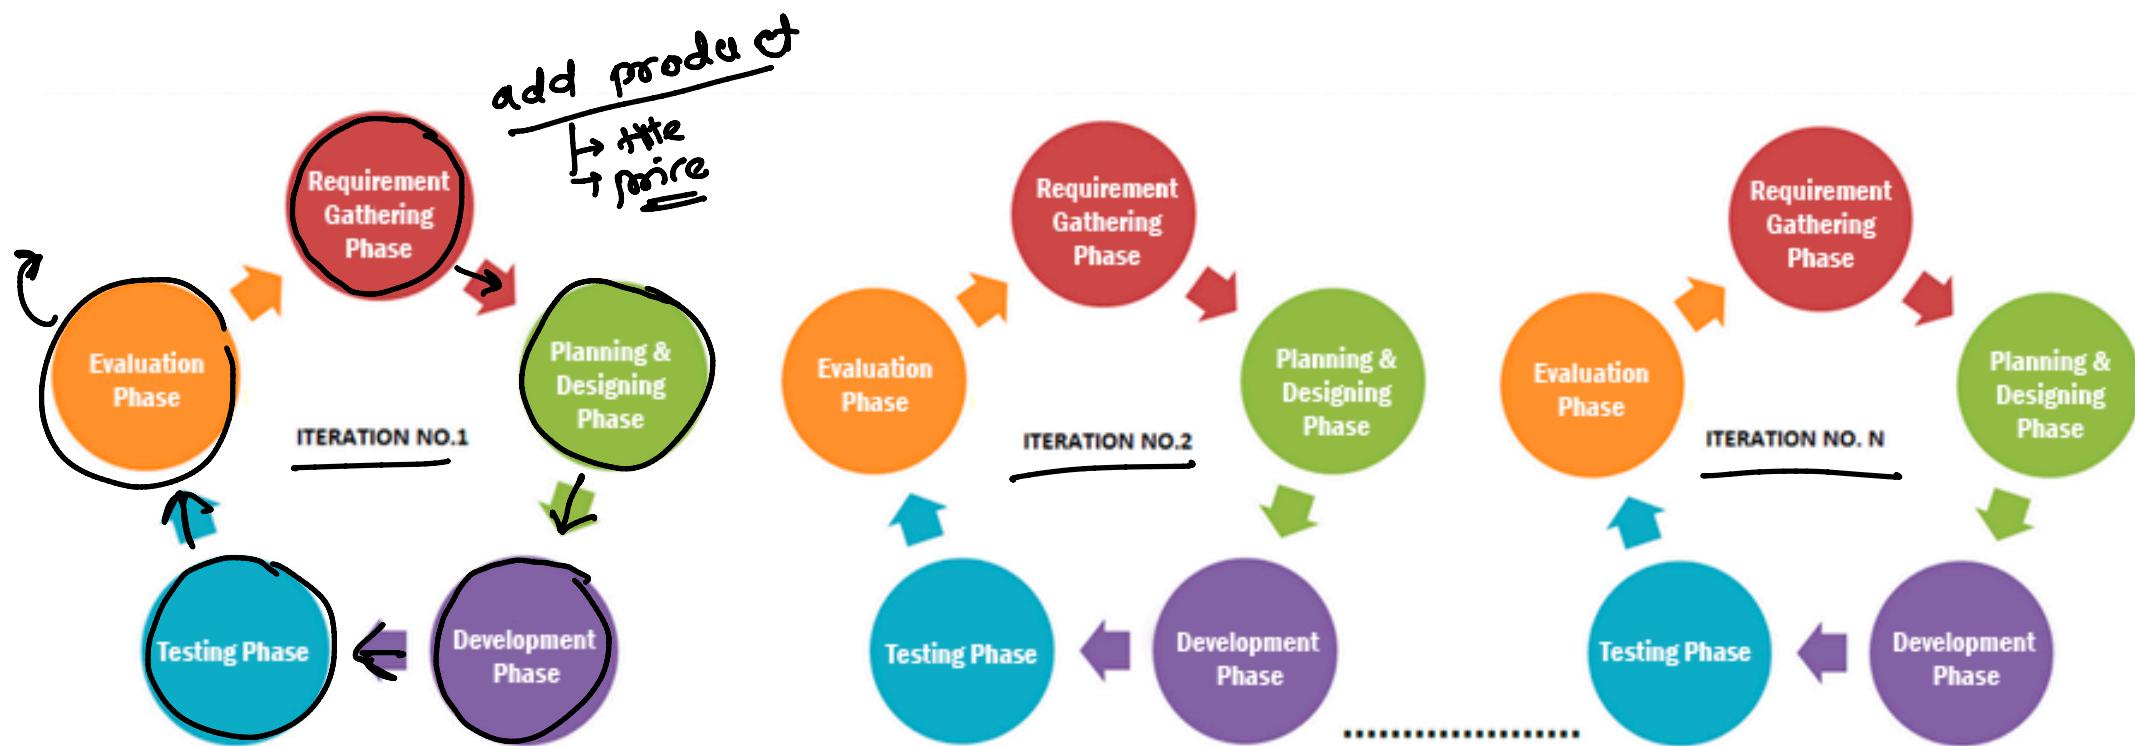

# Agile Methodologies

# Agile Methodologies

- Agile model believes that every project needs to be handled differently and the existing methods need to be tailored to best suit the project requirements
- The tasks are divided to time boxes (small time frames) to deliver specific features for a release
- Iterative approach is taken and working software build is delivered after each iteration
- Each build is incremental in terms of features; the final build holds all the features required by the customer

# Agile Model

**AGILE SOFTWARE DEVELOPMENT**

# Agile Manifesto

task

- Individuals and interactions
  - self-organization and motivation are important
- Working software
  - Demo working software is considered the best means of communication with the customers to understand their requirements, instead of just depending on documentations
- Customer collaboration
  - continuous customer interaction is very important to get proper product requirements
- Responding to change
  - focused on quick responses to change and continuous development

# Agile Methodologies

- The most popular Agile methods include

- ↳ Rational Unified Process

- Crystal Clear
  - Extreme Programming
  - Adaptive Software Development
  - Feature Driven Development
  - Dynamic Systems Development Method (DSDM)

- ↳ Kanban

# Agile Methodologies - Scrum

- Is an agile way to manage a project
- Management framework with far reaching abilities to control and manage the iterations and increments in all project types
- One of the implementations of agile methodology ↪
- Incremental builds are delivered to the customer in every two to three weeks time
- Ideally used in the project where the requirement is rapidly changing

# Agile Methodologies – Scrum Terminologies

- **Scrum**: a framework to support teams in complex product development
- **Scrum Board**: a physical board to visualize information for and by the Scrum Team, used to manage Sprint Backlog
- **Scrum Master**: the role within a Scrum Team accountable for guiding, coaching, teaching and assisting a Scrum Team and its environments in a proper understanding and use of Scrum
- **Scrum Team**: a self-organizing team consisting of a Product Owner, Development Team and Scrum Master
- **Self-organization**: the management principle that teams autonomously organize their work

# Agile Methodologies – Scrum Terminologies

~ 5 days

- **Sprint:** time-boxed event of 30 days, or less, that serves as a container for the other Scrum events and activities.
- **Sprint Backlog:** an overview of the development work to realize a Sprint's goal, typically a forecast of functionality and the work needed to deliver that functionality.
- **Sprint Goal:** a short expression of the purpose of a Sprint, often a business problem that is addressed
- **Sprint Retrospective:** time-boxed event of 3 hours, or less, to end a Sprint to inspect the past Sprint and plan for improvements

2 weeks

Sprint-time - 5 days

(A) Admin Panel

- 1) Product management
- ✓ 1 - add product
  - ✓ 2 - modify
  - ✗ 3 - delete
  - ✓ 4 - list
- pair metadata
- sprint -1

2) User management

- ✓ 1 - manage admin users → backlog
- ✓ 2 - block end user
- 1 - unblock end user
- ✓ 2 - send bills

S3

3) Order management

- 3 - change order status
- 2 - close order
- 1 - suspend order

# Agile Methodologies – Scrum Terminologies

- **Sprint Review:** time-boxed event of 4 hours, or less, to conclude the development work of a Sprint
- **Stakeholder:** a person external to the Scrum Team with a specific interest in and knowledge of a product that is required for incremental discovery
- **Development Team:** the role within a Scrum Team accountable for managing, organizing and doing all development work
- **Daily Scrum:** daily time-boxed event of 15 minutes for the Development Team to re-plan the next day of development work during a Sprint
  - daily stand-up

# Agile Methodologies – Scrum Principles

- **Self-organization**

- This results in healthier shared ownership among the team members.
- It is also an innovative and creative environment which is conducive to growth.

- **Collaboration**

- Essential principle which focuses collaborative work

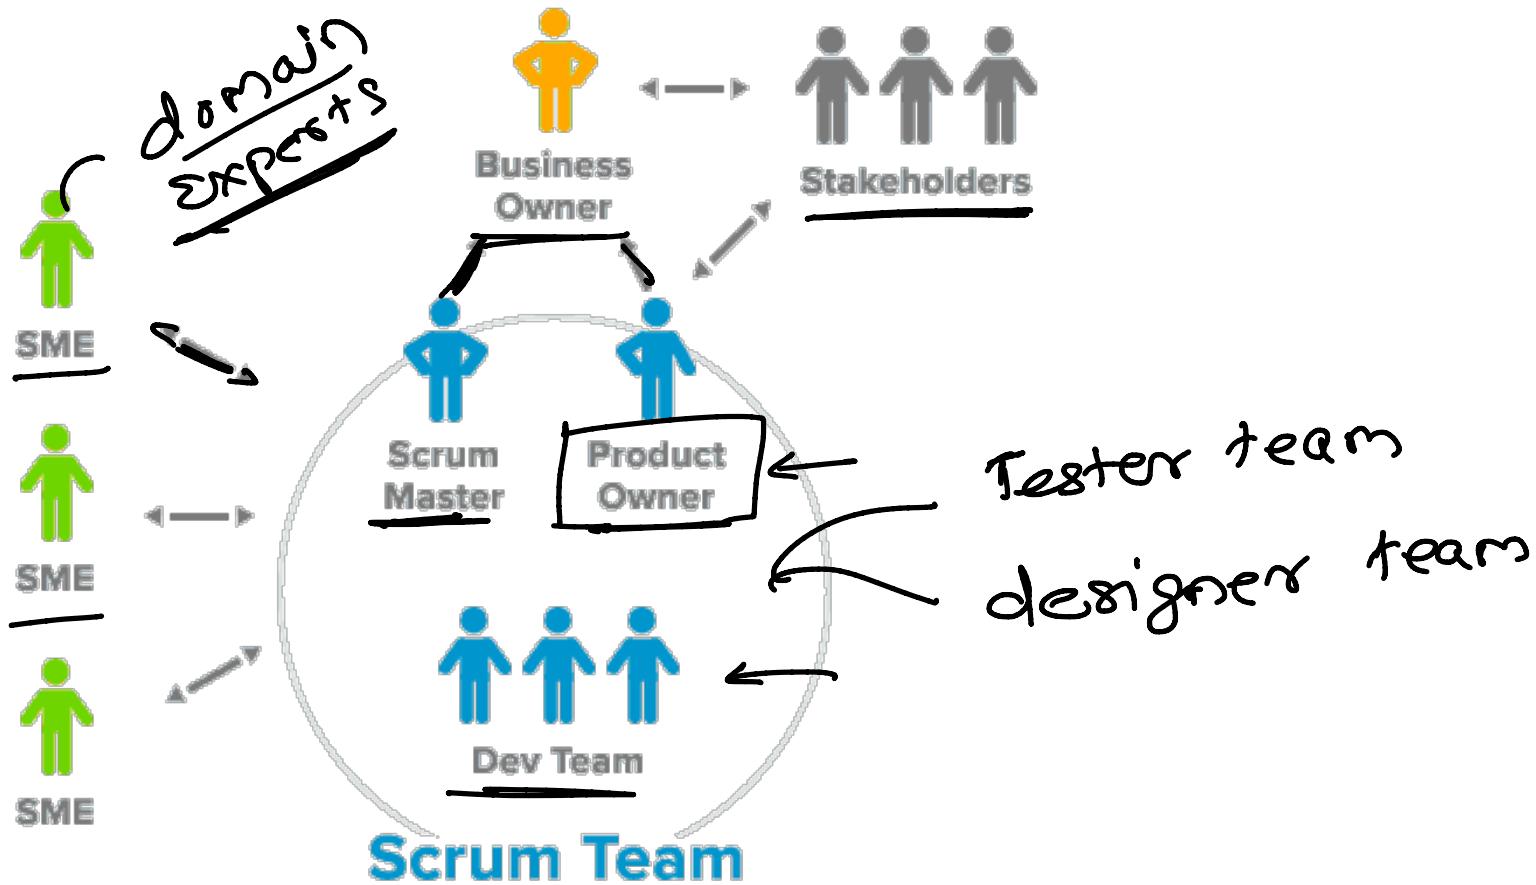

- **Time-boxing**

- Defines how time is a limiting constraint in Scrum method
- Daily Sprint planning and Review Meetings

- **Iterative Development**

- Emphasizes how to manage changes better and build products which satisfy customer needs
- Defines the organization's responsibilities regarding iterative development

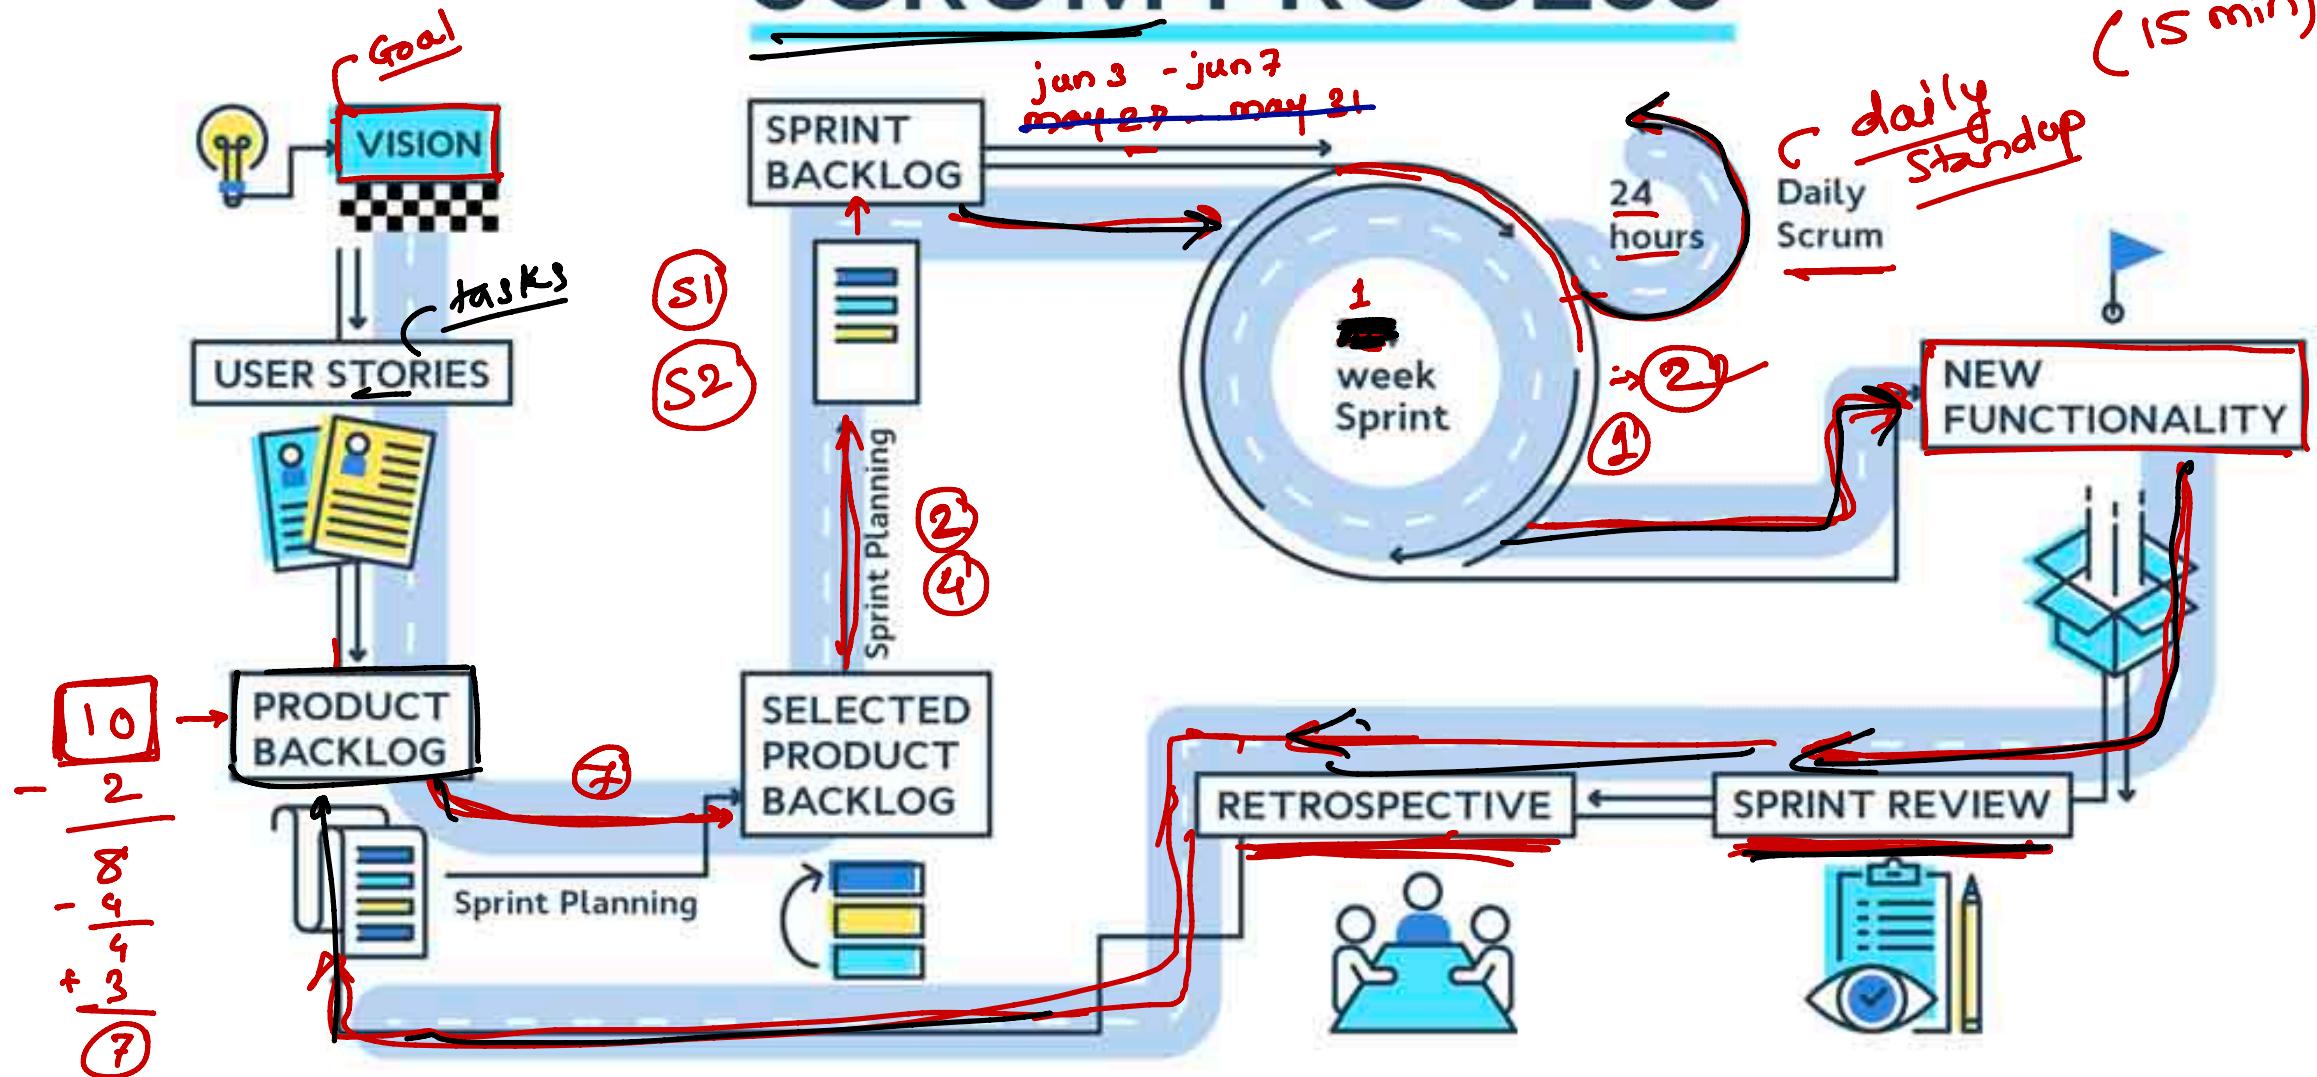

# Agile Methodologies – Scrum

Iterative

Sprint time - 1 week

# Agile vs traditional models

→ Agile manifesto

No	Agile Methodologies	Traditional Methodologies
1	<u>Incremental value and risk management</u>	Phased approach with an <u>attempt to know everything at the start</u> <u>(product as one)</u>
2	<u>Embracing change</u>	<u>Change prevention</u>
3	<u>[ Deliver early, fail early ]</u>	<u>Deliver at the end, fail at the end</u>
4	<u>Transparency</u>	<u>Detailed planning, stagnant control</u>
5	<u>Inspect and adapt</u>	Meta solutions, tightly controlled procedures and final answers
6	<u>Self managed</u>	<u>Command and control</u>
7	<u>Continual learning</u>	<u>Learning is secondary to the pressure of delivery</u>

# Agile - Advantages

- Very realistic approach to software development
- Promotes teamwork and cross training
- Functionality can be developed rapidly and demonstrated
- Resource requirements are minimum
- Suitable for fixed or changing requirements
- Delivers early partial working solutions ➔
- Good model for environments that change steadily
- Minimal rules, documentation easily employed
- Enables concurrent development and delivery within an overall planned context
- Little or no planning required
- Easy to manage
- Gives flexibility to developers

## Agile - Disadvantages

~~Scrum master~~

- Not suitable for handling complex dependencies.
- More risk of sustainability, maintainability and extensibility.
- An overall plan, an agile leader and agile PM practice is a must without which it will not work.
- Strict delivery management dictates the scope, functionality to be delivered, and adjustments to meet the deadlines.
- Depends heavily on customer interaction, so if customer is not clear, team can be driven in the wrong direction.
- There is a very high individual dependency, since there is minimum documentation generated.
- Transfer of technology to new team members may be quite challenging due to lack of documentation.
